

BOSKALIS ENVIRONMENTAL

Boskalis Environmental is involved in soil cleaning, the processing of dredged sediment, water and land remediations, resource reuse and depot management. We specialize in the large scale cleaning of contaminated soil and mineral waste. In doing so, we use techniques that we develop ourselves and installations that we design and build ourselves. We also take care of the entire process, including inspection, planning, transport and marketing of the partial flows.

Because we have our own technical service, engineering department and laboratory, we are able to carry out complex projects in full: from the preliminary research, the design and the project management, to the construction of the necessary installations, the implementation and the operations.

Boskalis Environmental works closely with Boskalis Netherlands and Boskalis International. Our products are used as building materials within Boskalis Netherlands (including Beaumix®). The Raw Materials Department takes care of its marketing and reuse in, amongst others, various projects of Boskalis Netherlands.

LAND REMEDIATION

Most of the time, land remediation is part of the redevelopment of polluted areas, the so-called Brownfields. In such redevelopment projects, we increasingly take control of the entire project, from the project design to the construction of new infrastructure. We work together with project developers and other branches of Boskalis. We also take care of soil remediations within the projects of Boskalis Netherlands.

A number of our employees are specialized in supervising and carrying out soil remediations, according to the applicable law and regulations. In doing so, we take care of the planning up to and including the delivery of the remediated area. A Higher Safety Expert is also employed, who ensures that all health and safety measures are taken during the remediation; a remediation is carried out safely for those directly involved and the surroundings.
