

BOSKALIS ENVIRONMENTAL

Boskalis Environmental is involved in soil cleaning, the processing of dredged sediment, water and land remediations, resource reuse and depot management. We specialize in the large scale cleaning of contaminated soil and mineral waste. In doing so, we use techniques that we develop ourselves and installations that we design and build ourselves. We also take care of the entire process, including inspection, planning, transport and marketing of the partial flows.

Because we have our own technical service, engineering department and laboratory, we are able to carry out complex projects in full: from the preliminary research, the design and the project management, to the construction of the necessary installations, the implementation and the operations.

Boskalis Environmental works closely with Boskalis Netherlands and Boskalis International. Our products are used as building materials within Boskalis Netherlands (including Beaumix®). The Raw Materials Department takes care of its marketing and reuse in, amongst others, various projects of Boskalis Netherlands.

SEDIMENT TREATMENT AND REMEDIATION

From the moment the sediment quality is known, or possibly even before that, we can offer our clients the entire remediation process, from the design phase of the installation to the execution and delivery. We also have a lot of experience with risk participation. The sooner we are involved in a project, the more accurately we can respond to complex issues, such as those that may arise in, for example, area development projects. If possible, we can use one of our mobile installations to process contaminated sediment on site.

In recent years, Boskalis Environmental has carried out a number of projects, involving the processing of contaminated sediment. Recently we have completed the Project Fox River in the USA. Our processing plant was directly connected to the dredging unit.

In addition to the remediation and processing of (contaminated) sediment, we can also carry out the depot design and management.
