

BOSKALIS ENVIRONMENTAL

Boskalis Environmental is involved in soil cleaning, the processing of dredged sediment, water and land remediations, resource reuse and depot management. We specialize in the large scale cleaning of contaminated soil and mineral waste. In doing so, we use techniques that we develop ourselves and installations that we design and build ourselves. We also take care of the entire process, including inspection, planning, transport and marketing of the partial flows.

Because we have our own technical service, engineering department and laboratory, we are able to carry out complex projects in full: from the preliminary research, the design and the project management, to the construction of the necessary installations, the implementation and the operations.

Boskalis Environmental works closely with Boskalis Netherlands and Boskalis International. Our products are used as building materials within Boskalis Netherlands (including Beaumix®). The Raw Materials Department takes care of its marketing and reuse in, amongst others, various projects of Boskalis Netherlands.

SOIL REMEDIATION

The Department of Soil Remediation consists of a number of specialists for carrying out land or waterbed remediation in accordance with the BRL 7000 guidelines. These specialists support the tenders and projects of Boskalis Nederland in the event of contaminated soil or dredged material. The entire process, from the detection of a soil contamination to the handover of the remediation, is monitored by this department. In addition to remediation for Boskalis, our department also carries out land and waterbed remediation for external clients.

During the process from tendering to evaluation of the soil remediation, we work closely with other disciplines within Boskalis Nederland as well as our own soil treatment locations.

Within our department we have specialists for processing of waste. We know the market of (waste) processors and provide projects with the right advice when it comes to the handling and marketing of secondary materials.

For the safe execution of the soil remediation under CROW 400, the SHEQ department (Safety, Health, Environment and Quality) is connected.
